

# Mass Update Asset Master Data (570)

## Automation Capability and Feature Highlights

### THE PROBLEM

Large enterprises tend to buy assets like mobile phones, office furniture, and computers in bulk. These assets are normally recorded with one or more additional specific identifiers (e.g. serial, inventory number, IMEIs for mobile phones, etc.) to facilitate asset tracking.

Asset Accountants have the challenge of recording into the system a high volume of newly acquired assets and their respective identifiers before the assets get distributed to the employees and placed in service. Also, additional information for depreciation may need to be entered into the system.

Due to the high volume and frequency of this task, this proves to be very resource and time intensive if carried out manually.

### Automation SKILL DESCRIPTION

- The automation provides users the capability to perform a mass update of Asset master data master into SAP S/4HANA Cloud systems based on an excel template and via API.
- The user completes the pre-defined Excel input template for the automation and saves the completed excel file in a specific folder.
- The automation reads all input Excel files from the folder, and updates the Asset data master in the SAP S/4HANA Cloud.

### BUSINESS VALUE – BENEFITS

- Reduce manual effort and time for high volume of data updates to master data records
